

Statement on the efficacy of Diesin maxx against Coronavirus

Background

Coronaviruses are enveloped viruses causing human infections. Two different guidelines are available to support efficacy of disinfectants against enveloped viruses: EN 14476, using Vacciniavirus as a surrogate virus and a guideline of the German Society for the Prevention of Virus Disease (DVV) using Vacciniavirus and Bovine Viral Diarrhea Virus (BVDV) as surrogate viruses.

Rationale

According to guidance of the European Centers for Disease Control¹⁾ a solution of 0.05% benzalkonium chloride can be used as an effective disinfectant against Coronavirus. Diesin maxx contains 2.45% (w/w) benzalkonium chloride. In addition to that it contains 8% (w/w) lactic acid as an active ingredient. The latter does not interfere with benzalkonium chloride, but has an additive or even synergistic effect.

Conclusion

Based on the above information and guideline it is concluded that Diesin maxx is effective against Coronavirus as a surface disinfectant at a concentration of 2% at the contact time needed to achieve a bactericidal effect.
